

ABSTRACT OF THE DISCLOSURE

The present invention discloses a contractible table leg structure, comprising:
an external sleeve; a folding rod, being a rod member with a cross section
substantially in successive V-shaped turning surfaces, and having an included
5 angle in the middle, a plurality of folding surfaces to define a plurality of interface
corners, and the folding rod being passed through the interior of said external
sleeve; a bold member, being secured on the external sleeve, and its inner end
corresponding to the included angle of the folding rod; and when said bold
member being tightly secured, so that said folding rod producing a deformation
10 stress to press the interface corner against the inner wall of the external sleeve and
fix the folding rod into a position.
